Utkarsh Verma(2415001713)

Vansh Baliyan(2415001732)

Under the Guidance of:-

Mr. Pankaj Kapoor

1. Introduction

Volunteer Connect is a mobile application that connects volunteers with NGOs through a single platform. Volunteers can browse opportunities, search and filter listings, view details, apply, and track their application status. NGOs can manage opportunities and volunteer applications through an admin panel. The app is built using **Flutter (frontend)** and **Django (backend)** with **SQLite** as the database, communicating via **HTTP and JSON**.

2. Problem Statement

Volunteers often struggle to find suitable opportunities because information is spread across multiple platforms, while NGOs face challenges in managing opportunities and applications manually. Volunteer Connect provides a centralized platform that simplifies opportunity discovery, application tracking, and NGO management, making the volunteering process more efficient for both volunteers and organizations.

3. Objectives of the Project

- Develop a centralized platform for volunteers and NGOs.
- Enable volunteers to browse, search, and apply for opportunities.
- Allow NGOs to manage opportunities using CRUD operations.
- Store volunteer, opportunity, and application data in SQLite.
- Provide application status tracking.
- Build a user-friendly and responsive Flutter mobile app.

4. Proposed Methodology / Solution Approach

Volunteer Connect provides a centralized mobile platform where volunteers can discover and apply for volunteering opportunities.

System Roles

Volunteer

- Register & Login
- Browse, search, and filter opportunities
- View details & apply
- Track or cancel applications
- Manage profile

Admin / NGO

- Login
- Create, update, and delete opportunities
- View opportunities and applicants
- Approve or reject applications

The backend will manage the application data and CRUD operations using Django and Django ORM.

5. Technologies Used

Technology	Purpose
Flutter	Mobile application development
Dart	Programming language
Django	Backend development
SQLite	Database
JSON	Data exchange
Django Media	Profile image handling
Git/GitHub	Version control

6. System Architecture

The system follows a client-server architecture:

Flutter Mobile Application-> HTTP / JSON-> Django Backend-> Django Views-> Django ORM-> SQLite DB

The Flutter application acts as the client, while Django handles backend logic, CRUD operations, and database communication.

7. Expected Outcomes

The application will:

- Reduce the difficulty of finding volunteer opportunities.
- Simplify the application process.
- Help NGOs manage opportunities efficiently.
- Provide centralized application records.
- Demonstrate practical implementation of CRUD operations using Django.
- Provide a responsive mobile interface using Flutter.

8. Conclusion

Volunteer Connect provides a centralized platform that connects volunteers with NGOs, making opportunity management and volunteer applications simple and efficient. Built with **Flutter**, **Django**, and **SQLite**, the project offers a user-friendly solution and serves as a strong foundation for future enhancements.
